# THE ANDREWS NURSERY

ESTABLISHED 1872  
FARIBAULT, MINNESOTA

Plums:

## MINNESOTA NO.91.

Shiro crossed with Wyant.

This is the EARLIEST of the large plums, the largest being  $1\frac{3}{4}$  inches in diameter. The tree is a strong grower, the limbs being well distributed and the size of the main trunk being carried up well, the branches are less likely to split down than is the case with the ordinary varieties. Appears to be hardy -- will stand in a more severe climate than Nos. 12 and 21..

Fruit yellow turning to light red when ripe; hangs on tree until picked; fruit clingstone, firm and keeps well; quality very good; pit small.

MINNESOTA NO.91, having Japanese plum "blooä", is not affected by the plum pocket fungus which causes many of the common varieties to "puff up" in early summer. Its early ripening puts the fruit out of danger of injury from freezing in the fall.

## MINNESOTA NO.12.

Burbank crossed with Wolf.

Fruit large, up to  $1\frac{3}{4}$  inches in diameter; freestone; firm; skin tender, yellow covered with red on sunny side; quality sweet and very good for all purposes. Pit small. Ripe middle to last of August, according to the season.

Tree appears to be hardy in latitude of St. Paul and south.

## MINNESOTA NO.21.

Of same pedigree as Minnesota No.12, and much the same in size and quality of fruit except it is about a week earlier. Not quite so perfect a freestone as the No.12. Good grower and heavy bearer.
